Stock Market Task

API URL

https://market-data-collector.firebaseio.com/market-collector.json

Create a page with four links to four different pages:

- Crypto `/crypto/`

- Currencies `/currencies/`

- Indexes `/indexes/`

- Markets `/markets/`

For each of the pages render the list of instruments. Clicking on an item in the list should render a detail page.

For Markets, make sure to render a separate page for each market, i.e. /markets/nasdaq and /markets/first-north

For each market, render a list of all companies listed on that market. Clicking on a company or instrument should show the detail page for that company.

Make sure you use Context to minimize the number for requests to the back-end server. Extra points for storing the payload in localstorage / sessionstorage.
